## Camera protection housing for AXIS Q60/P55 modells

### Berlin subway project

Our customer, the BVG in Berlin , faces a problem when they mounted the AXIS domcameras. In the most subway stations the ceiling is very low, so when you mount the camera with the original ceiling mount from AXIS it is possible to reach the camera. Also it is possible, if you jump up , to grab the camera and break it.

For this issue we've been asked to design a protection housing to avoid this problems.

In the picture below you can see the original mounted camera together with the new solution

Our solution is a stainless steel housing which can be mounted directly to the ceiling. So you can't see any cable and it is not possible to jump up and hold on to the housing.

The topside can be locked with a special key for installation.

Below you see a second mounting example

After testing this solution the BVG will mount 100 housing round Berlin in this year. In addition we will deliver different mounting kits because all the stations are different and requires custom made mountings to get the housing right to the ceiling
